The Pythagorean theorem: The sum of the areas of the two squares on the legs ($a^2 + b^2 = c^2$) We can also show this equation with a diagram, as on the right, where each side of the square has length c . Or if the answer were 11 cm or less than you'd know that you hadn't got the length. It has a square base and the square has sides of length cubits.

While reading about this on Wikipedia I have seen some equation which is still difficult for me to comprehend. This assumption is certainly not testable, and it is almost certainly false.

The Psalms probably had rhyme and meter in their original tongue, for example. Are we meant to conclude that all three places enshrine a very accurate value of pi? If the hypotenuse c is known, and the length of one of the legs must be found, the following equations can be used:

I am just having trouble figuring what might have required any sort of consistency. In any rate, the numbers will tell the tale. For a comprehensive discussion, see [7];[8].
